Current Individual

This was calculated as a student living in the dorms, there are individual controlled factors as well as those accounted for the general public.

Future Family of Four

Calculated as if the family was living in a single, detached house, and made intentional attempts to be more sustainable.

Average Household

Statistics on the average American household.

Why the difference?

In a dorm, there are many needs and sustainability options that need to be limited in order to cater to the large number of people living in one area, at an affordable price. My future family plan takes into account variables like driving an electric car and using energy-efficient appliances.
