

Data and Information Management in the Built Environment

Mark A. Austin

University of Maryland

austin@umd.edu

ENCE 688P, Fall Semester 2020

January 26, 2022

Overview

- 1 Definition and A Little History
- 2 Near-Term Challenges (2020-2060)
- 3 Features of Modern Computing
- 4 Cyber-Physical and Digital Twin Systems
- 5 Engineering Sensor Systems
- 6 Urban and Global Applications

Getting Started

Definition of Built Environment

Various Sources (Google, ScienceDirect):

- **Human-made surroundings** that provide for **human activity**, ranging in scale from **buildings to cities**.
- Includes supporting infrastructure: **water supply** networks; **energy** networks; **transportation** systems, **communication** systems.

Human Needs:

- Basic: Access to **clean air** and **clean water**.
- Health: Access to good **medical services**.
- Economic: Affordable low maintenance **housing**.
- Security: Protections against **crime**, **environmental attack**.

Definition of Built Environment

- Transportation: Good **roads**; parking; fast access to work.
 - Educational: Access to good **schools**.
 - Green Spaces: Access to **parks**, bike paths, etc.
 - Retail: Access to **shopping**; reliable **supply chains**.
 - Lifestyle: Access to social and recreational **spaces**.
-

Urban Planning and Engineering Concerns:

- Understand short- and long-term planning needs.
- Efficiency in design – aesthetically pleasing design.
- Efficiency in operations – better use of limited resources.
- Improved response to unexpected events.

Framing the Opportunity

We seek:

- **Data-driven** approaches to **measurement of performance** in the building environment and **identification of trends and patterns** in **behavior**.
- Solutions that account for **unique** physical, economic, social and cultural **characteristics** of **individual cities**.

Sources of Complication:

- Multiple domains; multiple types of **data and information**.
- Network **structures** that are **spatial** and **interwoven**.
- **Behaviors** that are **distributed** and **concurrent**.
- Many **interdependencies** among **coupled urban subsystems**.

Framing the Opportunity

Systems Perspective:

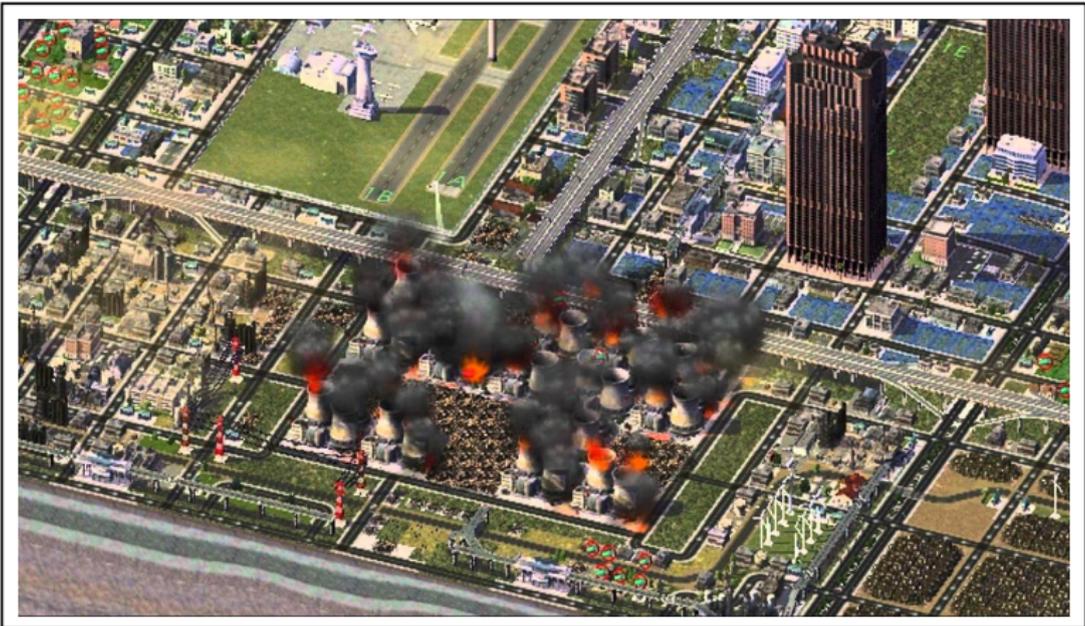

- Entities in the built environment have both **system structure** and **system behavior**

Decision makers use **behavior modeling** to **understand**:

- Sensitivity of systems to model parameter choices.
- Influence of **resource constraints**.
- Potential **emergent** interactions and **propagation** of **cause-and-effect relationships**.
- Identification of parts of the systems that are **vulnerable**.

Cannot play with a real building/city – so a reasonable **first step** is **data-driven building science** in **gaming environments** ...

Framing the Opportunity

Framing the Opportunity

Premise of this Class:

- Data mining and machine learning technologies can enhance (not destroy) the built environment.
-

Basic Questions:

- What are the challenges facing the built environment in the time frame 2020-2060?
- Is present-day technology where it needs to be to make a worthwhile contribution?
- What will the data mining do? What will the machine learning do?
- Are there opportunities for AI, data mining and machine learning to work as a team?

What is Civil Engineering?

Civil Engineering deals with (Civil Engineering, Wikipedia) ...

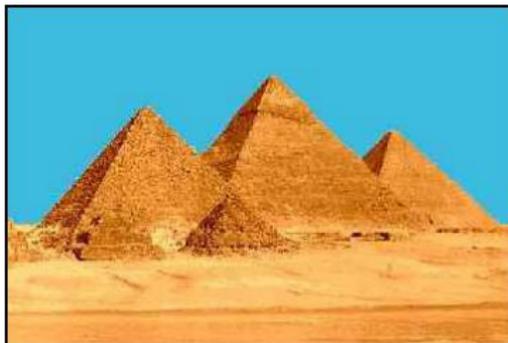

.. the design, construction, and maintenance of the physical and naturally built environment, including roads, bridges, canals, dams, and buildings.

After military engineering, civil engineering is the oldest engineering profession.

Goals during Early Civilization (4000 BC – 6000 BC)

- Problems of survival and basic systems were solved.
- Design and construction methods evolved.

Exemplars of Early Work

- Great Pyramid of Giza, Egypt (20 year construction; finished 2556 BC).
- The Parthenon in Ancient Greece (447-438 BC).
- Construction of the Great Wall of China (220 BC).
- The Romans developed civil structures throughout their empire, including especially aqueducts, insulae,

Industrial Revolution

Fast forward to the Industrial Revolution

Year	Milestone
1692	Languedoc Canal. 240 miles long. 100 locks.
1708	Tull's mechanical seed sower → large-scale planting.
1765	Spinning jenny/wheel automates weaving of cloth.
1775	Watt's first efficient steam engine.
1801	Robert Trevithick demonstrates a steam locomotive.
1821	Faraday, electro-magnetic rotation → electric motor.
1834	Babbage analytic engine → forerunner of the computer .
1903	Wright brothers make first powered flight.
1908	Henry Ford mass-produces the Model T.

Industrial Revolution

Advances in Civil Engineering during the Industrial Revolution

Year	Milestone
1854	Bessemer invents steel converter.
1849	Monier develops reinforced concrete.
1863	Siemens-Martin makes steel available in bulk.

Skyscrapers

- New materials → design of tall structures having large open interior spaces.
- Elevators (1857) → vertical transportation building occupants.
- Mechanical systems → delivery of water, heating and cooling.
- Collections of skyscrapers → high-density CBDs/commuter society.

Industrial Revolution

Industrial Revolution Actually Changed the World!

Characteristics	Stage 1 Mechanical Era	Stage 2 Electrical Era
Onset in the U.S.	Late 1700s.	Late 1800s.
Economic Focus	Agriculture/Mining	Manufacturing
Productivity Focus	Farming	Factory
Underlying Technologies	Mechanical Tools	ElectroMechanical
Product Lifecycle	Decades	Years
Human Contribution	Muscle Power	Muscle/Brain Power
Living Standard	Subsistence	Quality of Goods
Geographical	Family/Locale	Regional/National

Industrial Revolution (Mid-1900s)

New types of systems – planes, trains and automobiles – rely on **human involvement** as a means for **sensing and controlling behavior**, e.g.,

- Driving a car,
- Manual collection of road tolls,
- Traffic controllers at an airport,
- Manual focus of a camera.

Systems work, but:

- Humans are slow.
- Humans make mistakes.
- They also easily tire.

Transition to Information Era

Since 1990 we have been in an Information Era

Characteristics	Stage 2 Electrical Era	Stage 3 Information Era
Onset in the U.S.	Late 1800s.	Late 1900s.
Economic Focus	Manufacturing	Services
Technologies	ElectroMechanical	Information
Product Lifecycle	Years	Months
Living Standard	Quality of Goods	Quality of Life
Geographical Impact	Regional/National	Global

Design of Information-Age Systems

Premise of Information-Age System Design:

- Advances in **computer software**, **sensing**, and wireless **networking technologies** can work together to **expand** the **functionality** and **performance** of systems.

Trend toward Automation:

- New types of systems where **human involvement** for management of system functionality is **replaced** (or partially replaced) by **software automation**.

Civil Engineering Applications:

- Automated road toll collection (Rt. 200).
- Automated baggage handling systems at airports.

Transition to Information Era

Metrics of Good Engineering Design:

- A good engineering design **works correctly**, has **good performance**, and is **economical**.
- Functionality and performance are resilient to uncertainties.
- System can be **easily upgraded** to take advantage of **new technologies**.

Metrics of Good Systems Operation:

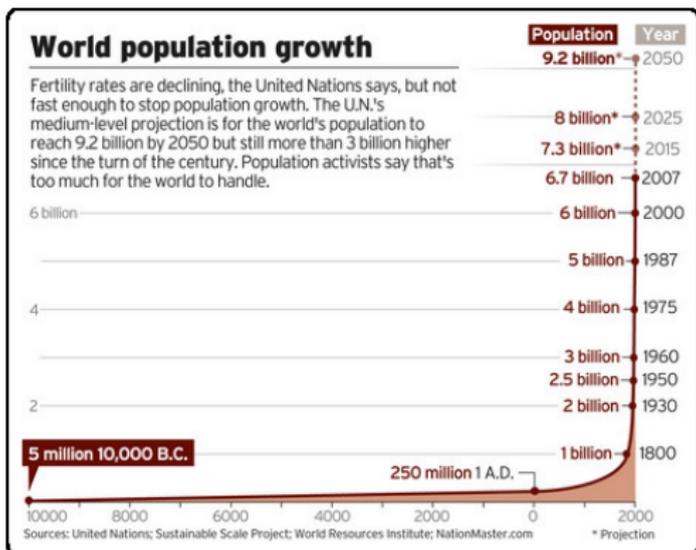

A well-run system has “situational awareness” and handles unexpected events:

- **Sense** the **system state** and **surrounding environment**,
- **Look ahead** and anticipate **events**, and
- Take action to control **system behavior**.

Near-Term Challenges

Civil Engineers need to **create** the
infrastructure for citizens of the
Information Era

Trends in World Population Growth

Increasing Population → Increased Demand on Limited Resources
→ Increasing need for Improvements to System Efficiency.

Urbanization and Sustainable Cities

Urbanization in America:

- In 2010, 82 percent of Americans lived in cities.
- By 2050 it will be 90 percent.

Cities are responsible for:

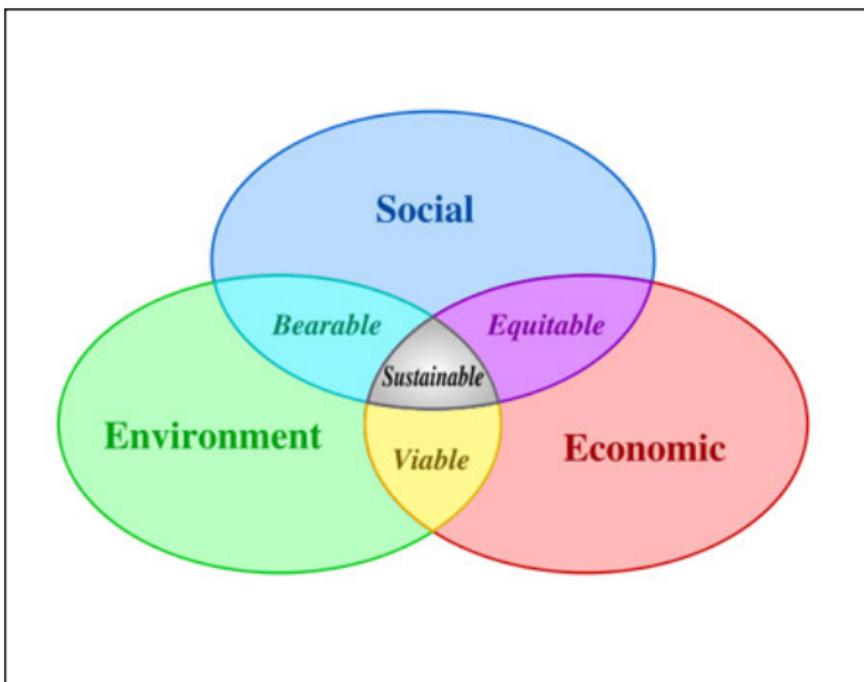

- Two thirds of the energy used,
- 60 percent of all water consumed, and
- 70 percent of all greenhouse gases produced worldwide.

Sustainable cities (SIEMENS, Sustainable Cities, USA):

- Environmentally friendly infrastructures;
- Improved quality of life for residents;
- Good economics.

Sustainable Urban Systems

Sustainability involves **physical**, **organizational** and **social** systems.

Sustainable Urban Systems

Urban systems are like plants in your garden:

- Cities are defined by their **emergent properties** (e.g., beautiful flower \Leftrightarrow New York City Skyline).
- Cities **grow and flourish** based on societal and economic stimulus, and **fall into decay** when stimulus is absent.

But sustainability is a tough problem:

- Many of the world's large urban areas – so-called **mega-cities** – are in **poor economic shape**.

Cities are **system of systems**:

- Subsystems have a preference to **operate** as **independently as possible** from the other subsystems.
- Strategic **collaborations needed** to **limit cascading failures**.

Resilience of Urban Infrastructure

Example. Cascading Failures in Hurricane Katrina

- Hurricane Katrina caused a storm surge which, in turn, resulted in the failure of levees around New Orleans.
- This is a failure in the waterway network.
- A more conservative (expensive) design might have prevented this failure.
- But the failure didn't stop there.

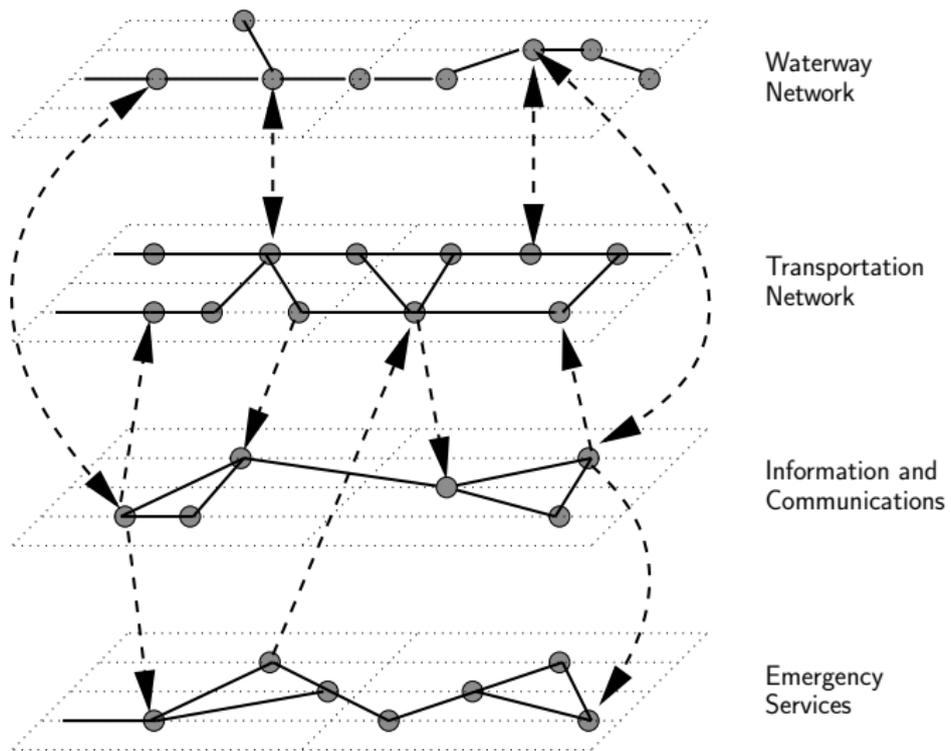

Resilience of Urban Infrastructure

Cascading Failures in Hurricane Katrina:

- **Waterway system failure.** The levees were insufficient to resist the storm surge.
- **Highway and electrical power system failures.** Flooding resulted in failure of the electrical power and highway systems.
- **Federal emergency failures.** Inhabitants had to flee their homes, but few plans were in place for their orderly evacuation.
- **Social network failures.** After the inhabitants left their homes, looters stole property from evacuated properties.
- **Political system failures.** ...

Dependencies Among Urban Networks

Planning for Disaster Relief and Recovery

Lessons Learned

Cascading failures of this type indicate that:

- There is a need to **understand** and **manage interactions** among **infrastructure networks** and **organizational** and **societal factors**.

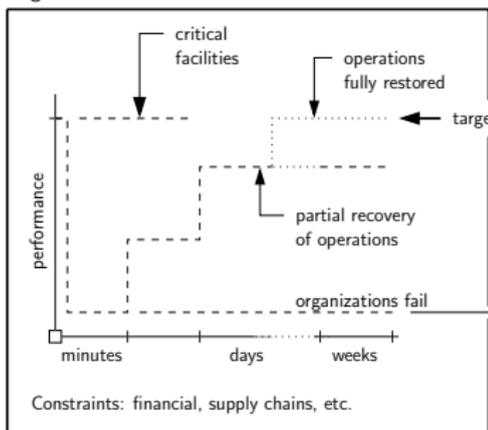

Basic Questions

- What kinds of dependencies exist between the networks?
- How will a failure in one network impact other networks?
These are so-called **cascading failures**.
- What parts of a system are most vulnerable?

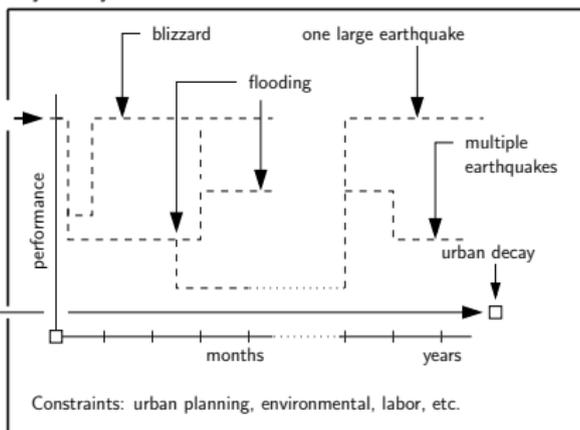

We need to look at **interactions between network models**.

Planning for Disaster Relief and Recovery

Organizational Infrastructure Resilience

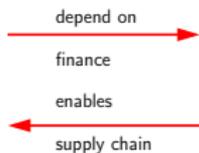

Physical System Infrastructure Resilience

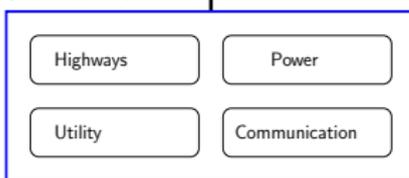

Organizations

resilience / performance

Urban Networks

resilience / performance

Features of Modern Computing

Key Question: How can we use modern computing technologies to **improve** Civil Engineering Systems?

Man and Machine (Traditional View)

Man	Machine
<ul style="list-style-type: none"> ● Good at formulating solutions to problems. ● Can work with incomplete data and information. ● Creative. ● Reasons logically, but very slow. ● Performance is static. ● Humans break the rules. 	<ul style="list-style-type: none"> ● Manipulates Os and 1s. ● Very specific abilities. ● Requires precise descriptions of problem solving procedures. ● Dumb, but very fast. ● Performance doubles every 18-24 months. ● Machines will follow the rules.

Sensible Problem Solving Strategy

Let engineers and computers play to their strengths:

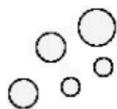

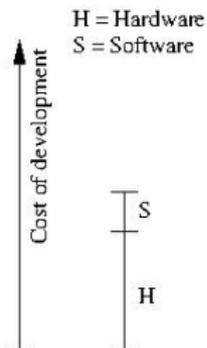

- Accelerates the **solution procedure**.
- Enables the analysis of problems having **size** and **complexity** beyond **manual examination**.
- Adds value in areas that will lead to long-term economic growth.

Getting things to work We need to:

- Describe to the computer solution procedures that are completely unambiguous.
- Look at data, organization and manipulation of data, and formal languages.

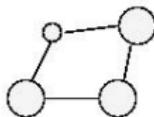

Expanding Expectations of Computing

Economics of computing and systems development

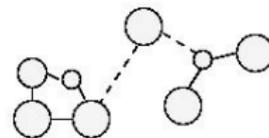

Task-oriented programs
and modules.
Centralized operations

1970's and early 1980s.

Integrated systems and
services.
Distributed operations.

Early 1990s

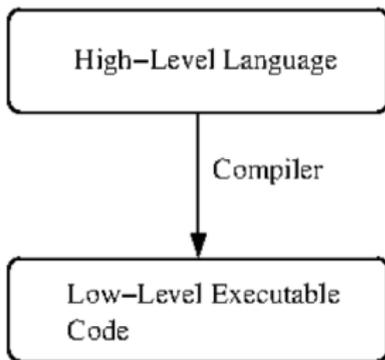

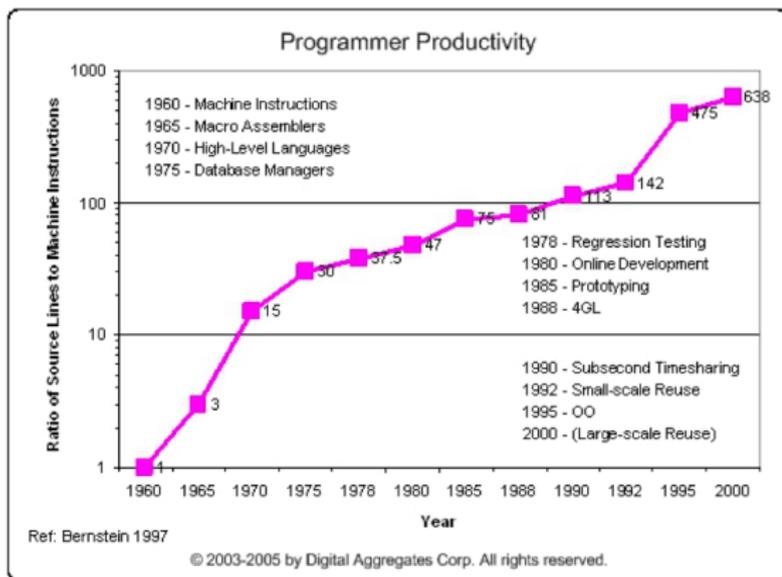

Integrated systems and
services.
Dynamic and mobile
distributed operations.

Mid 1990s – today

Pathway to Improved Programmer Productivity

Increasing System Complexity: Software programmers need to find ways to solve problems at high levels of abstraction.

Evolution of Computer Languages

Computer Languages. Formal description – [precise grammar](#) – for how a problem can be solved.

Evolution. It takes about a decade for significant advances in computing to occur:

Capability	1970s	1980s	1990s
Users	Specialists	Individuals	Groups
Usage	Numerical computations	Desktop computing	E-mail, web, file transfer.
Interaction	Type at keyboard	Screen and mouse	audio/voice.
Languages	Fortran, C	MATLAB	HTML, Java

Popular Computer Languages

Tend to be **designed** for a **specific set of purposes**:

- FORTRAN (1950s – today). Stands for formula translation.
- C (early 1970s – today). New operating systems.
- C++ (early 1970s – today). Object-oriented version of C.
- MATLAB (mid 1980s – today). Stands for matrix laboratory.
- Python (1990s – today). A great scripting language.
- HTML (1990s – today). Layout of web-page content.
- Java (1994 – today). Object-Oriented language for network-based computing.
- XML (late 1990s – today). Description of data on the Web.

Post- 2000 Era

Imagine: What if COVID-19 had arrived in 2000?

- No iPhone, No iPad, No iTunes.
- No Facebook, No Instagram, No WhatsApp.
- No Google Maps, No Google Streetview.
- No Dropbox, No Zoom.

Recent Advances in Technology:

- Average internet speeds: In 2000, 0.07 Mbs; In 2009, 5-7 Mbs; In 2020, 100-200 Mbs; 5G, 1000-2000 Mbs.
- Cloud-based data storage and computational services (AWS).
- New languages: Swift → App development on iPhone/iPad.
- Many new types of **sensors** and **methods of data collection**.

Post- 2000 Era

New Computing Infrastructure → New Architectures, Languages, ...

Capability	2000-present	2020-2030
Users	Groups of people, sensors and computers.	Integration of the cyber and physical worlds.
Usage	Mobile computing. Control of physical systems. Social networking.	Embedded real-time control of physical systems.
Interaction	Touch, multi-touch, proximity.
Languages	XML, RDF, OWL.	New languages to support time-precise computations.

Post- 2000 Era

And just in case you were wondering:

Google: cloud computing origin of term

Cyber-Physical Systems

New Computing Infrastructure → New System Abstractions

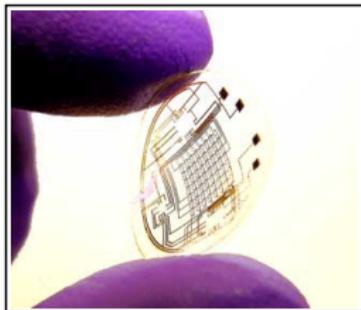

Cyber-Physical Systems

General Idea

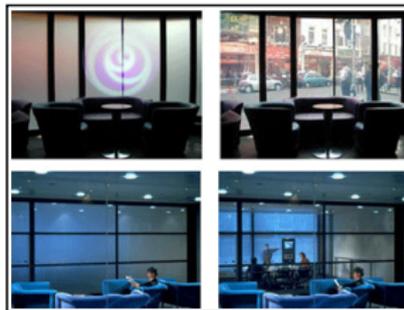

Embedded **computers** and networks **monitor and control** the **physical processes**, usually with **feedback loops** where **computation affects physical processes**, and vice versa.

Two Examples

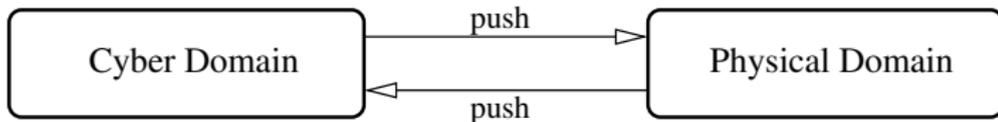

Programmable Contact Lens

Programmable Windows

Cyber-Physical Systems Overview

C-P Structure

Cyber capability in every
physical component
Executable code
Networks of computation
Heterogeneous implementations

Spatial and network abstractions

- physical spaces
- networks of networks

Sensors and actuators.

C-P Behavior

Dominated by logic
Control, communications
Stringent requirements on timing
Needs to be fault tolerant

Physics from multiple domains.
Combined logic and differential equations.
Not entirely predictable.
Multiple spatial- and temporal- resolutions.

Cyber-Physical Systems

Physical System Concerns

- Design success corresponds to notions of **resilience** and **reliability**.
- Behavior is constrained by conservation laws (e.g., conservation of mass, conservation of momentum, conservation of energy, etc..).
- Behavior often described by families of **differential equations**.
- Behavior tends to be continuous – usually there will be **warning** of **imminent failure**.
- Behavior may not be deterministic – this aspect of physical systems leads to the need for **reliability analysis**.
- For design purposes, **uncertainties** in behavior are often **handled** through the use of **safety factors**.

Cyber-Physical Systems

Software System Concerns

- Design success corresponds to notions of correctness of functionality and timeliness of computation.
- Computational systems are **discrete** and **inherently logical**.
Notions of energy conservation ...etc... and differential equations do not apply.
- Does not make sense to apply a safety factor. If a computational strategy is logically incorrect, then “saying it louder” will not fix anything.
- The main benefit of software is that **functionality can be programmed** and then **re-programmed at a later date**.
- A **small logical error** can result in a **system-wide failure**.

Cyber-Physical Systems (Notable Failures)

Example 1. NASA's Mars Climate Orbiter, September 1999.

NASA's systems engineering process did not specify the [system of measurement](#). One of the development teams used Imperial measurement; the other metric.

When parameters from one module were passed to another during orbit navigation correct, no conversion was performed, resulting in \$125m loss.

Cyber-Physical Systems (Notable Failures)

Example 2. Denver Airport Baggage Handling System

1995. Baggage handling system is 26 miles of conveyors; 300 computers. Fixing the incredibly buggy system requires additional 50 percent of the original budget - nearly \$200m.

2005. System still does not work. Airport managers revert to baggage carts with human drivers.

Source: Jackson, Scientific American, June 2006.

Cyber-Physical Systems (Error-Free Software)

Embedded computer systems and software need to deliver functionality that is **correct** and **works with no errors**.

CPS Design Requirements:

- **Reactivity**: System response need to occur within a known **bounded range and delay**.
- **Autonomy**: Systems need to provide **continuous service** without human intervention.
- **Dependability**: Systems need to be **resilient to attack** and **hardware/software failures**.
- **Scaleability**: System **performance** needs to **scale** with supplied **resources**.

Software for **smart electronic devices** is how **Java got started !!!**

Causes of Software-Related Accidents

Modern Software

Modern software is simply the **design of a machine** abstracted from its physical realization.

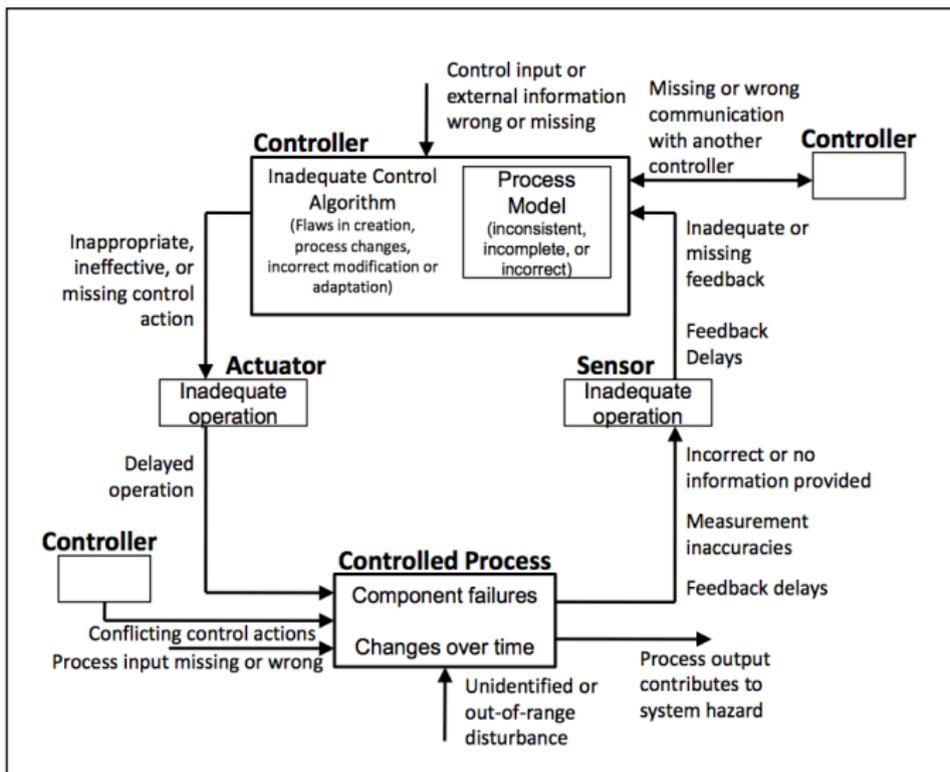

Software Accidents

Software accidents are usually **caused** by **flawed requirements** and **not** standard **wear-out failures**.

This includes:

- Incomplete (or wrong) assumptions about the operation of the controlled system or required operation of the software.
- Unhandled control system states and environmental conditions.

Engineering Sensor Systems (Error-Free Software)

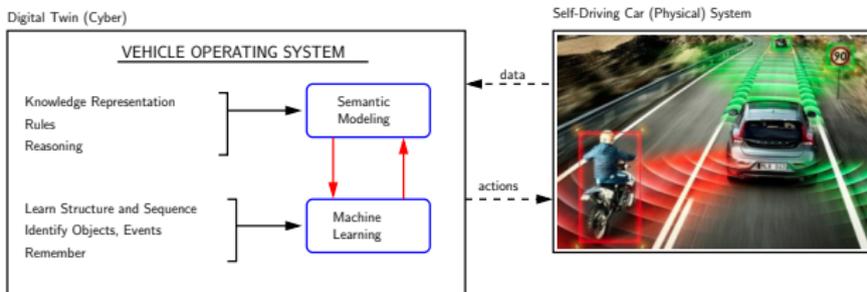

Digital Twin Systems

New Computing Infrastructure → New System Abstractions

Digital Twins (2000-today)

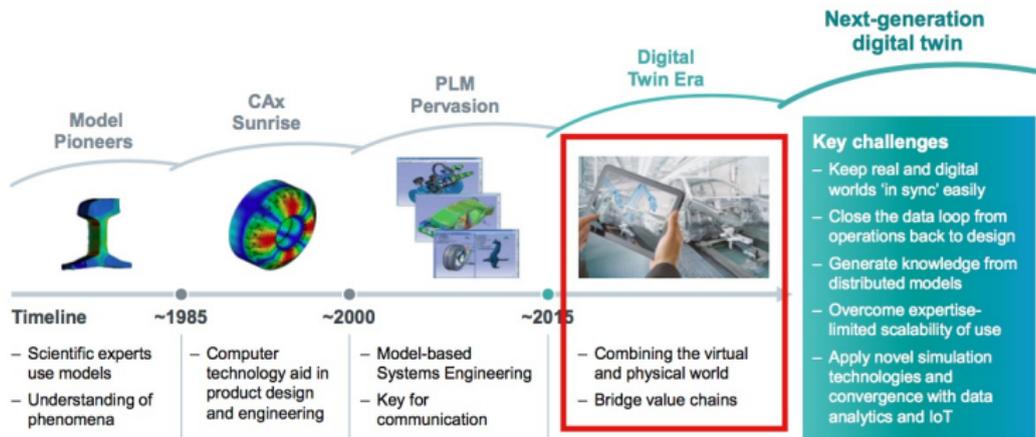

Definition. Virtual representation of a physical object or system that operates across the system lifecycle (not just the front end).

Required Functionality

- Mirror implementation of physical world through real-time monitoring and synchronization of data with events.
- Provide algorithms and software for observation, reasoning, and physical systems control.

Digital Twins (Business Case + Applications)

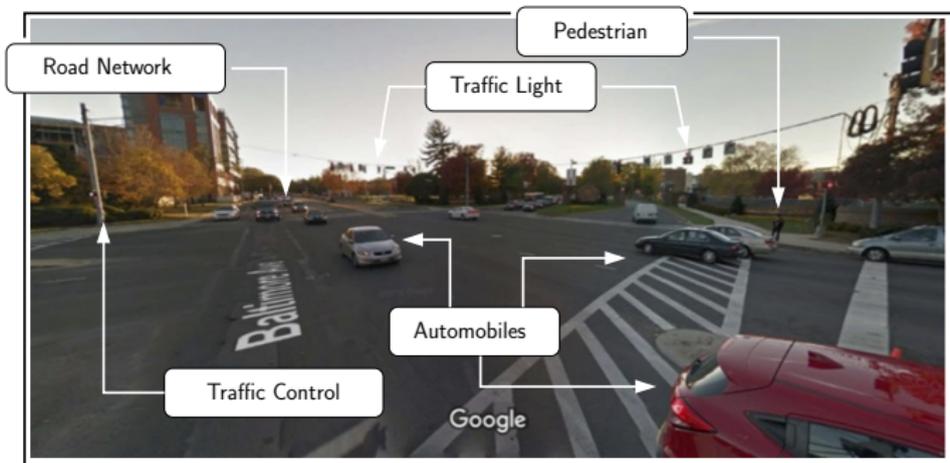

Many Applications

- NASA Spacecraft
- Manufacturing processes
- Building operations
- Personalized medicine
- Smart Cities
- ... etc.

Digital Twin Application (Self-Driving Car)

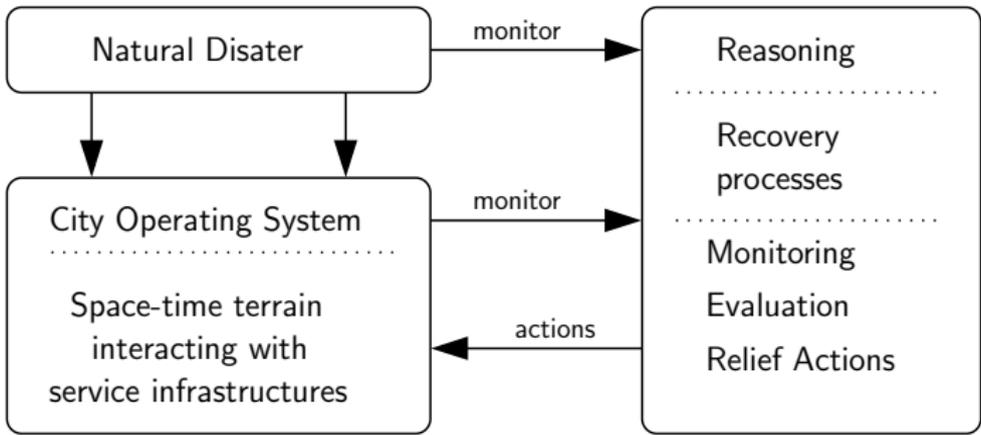

Goal. How to traverse traffic intersection safely and without causing an accident?

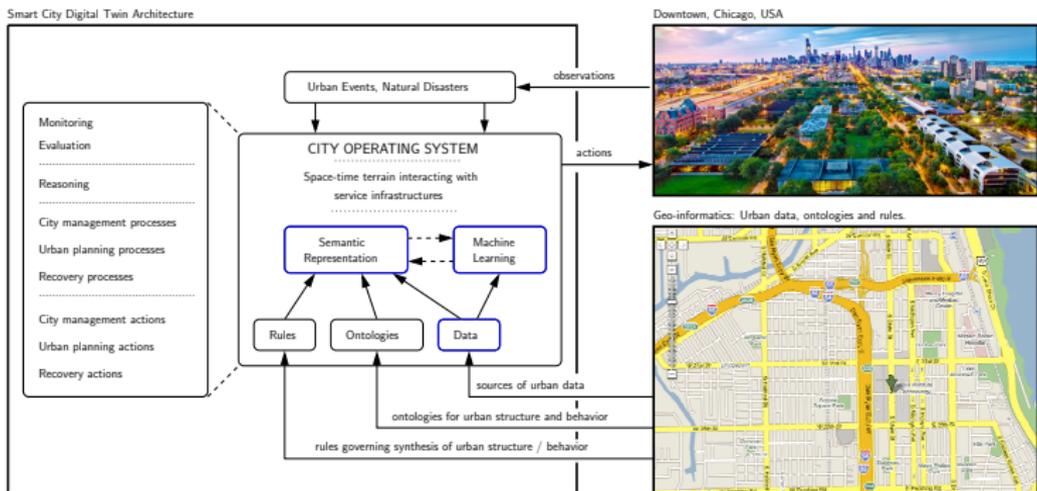

Required Capability. Observe, evaluate, reason, take actions.

Challenges. Multiple domains, multiple streams of heterogeneous data, event-driven behavior, dynamic, time critical.

Digital Twin: City Operating Systems

Smart City Digital Twins (2018-2019)

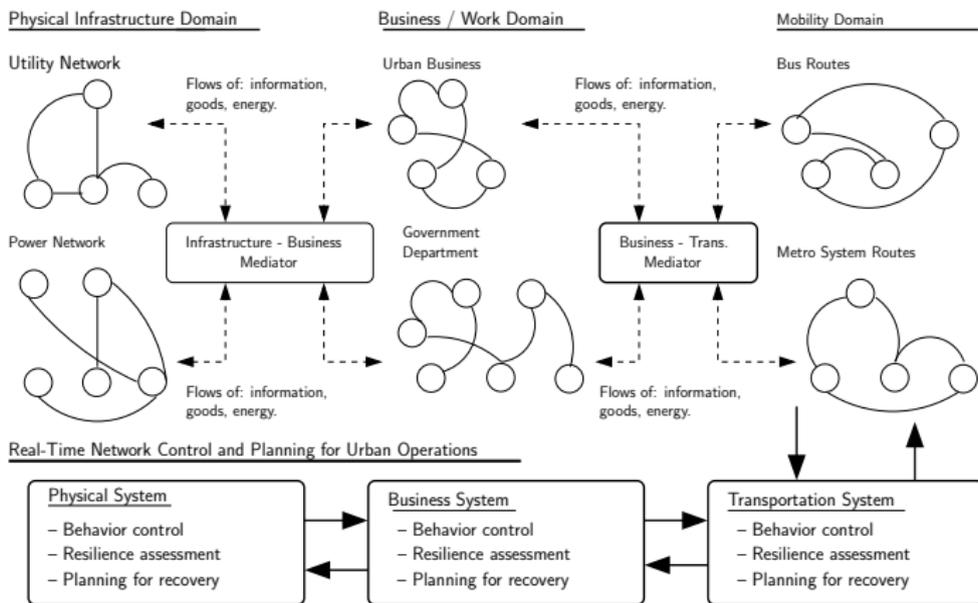

Required Capability. Monitoring and control of urban processes.

Complications. Potentially, a very large number of digital twins.

Distributed decision making.

Smart City Digital Twins (2018-2019)

Requirements. Support for digital twin **individuals** and digital twin **communities**.

Engineering Sensor Systems

Engineering Sensor Systems

General Opportunities for Sensing

- Enhanced levels of **attainable performance** ...
- Create **new** forms of **functionality** ...
- Improved **economics** and **operational efficiency** (energy consumption).
- Improved **resilience** and **agility** ...

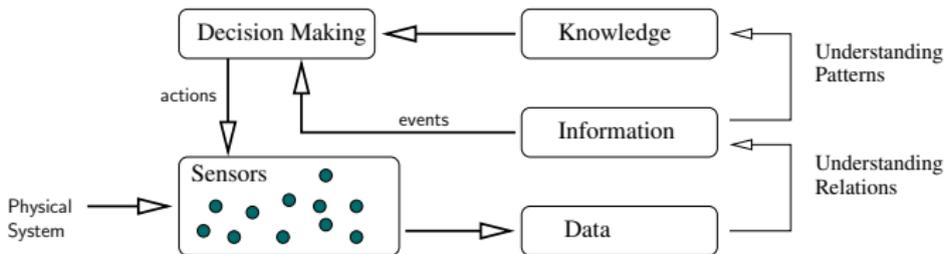

Sensing in the Built Environment

- We need sensors to serve as the **eyes** and **ears** of **control and information systems** designed to make buildings and cities more efficient and environmentally sensitive.

But how will such a system work?

Engineering Sensor Systems

Abstract Model for Sensor System Operations (Simplified!)

Implementation Options

- **Human** responsible for sensing and control.
- **Automation** (hardware and software) responsible for sensing and control.
- **Human and automation systems cooperate** in sensing and control.

Engineering Sensor Systems

Human-in-the-Loop Systems

Pros and Cons of Human Control:

- Human machine comes with five sensor types and reasoning capability builtin!
- Humans have **slow response**; **sub-optimal performance**; capabilities **degrade with age**. Approach **isn't scalable**.

Engineering Sensor Systems

Instrumented Systems:

Basic premise:

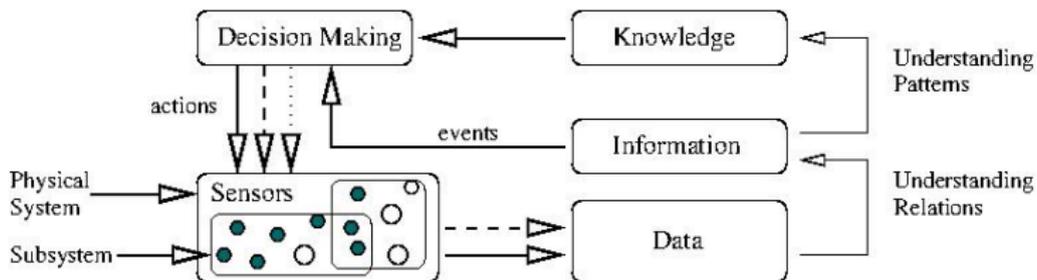

- Advances in **computing, sensing, and communications** technologies will allow for **new types of systems** where **human involvement** is **replaced** (or partially replaced) by **automation**.

Examples:

- Autofocus camera,
- Electronic systems in automobiles and planes → self-driving cars.
- Structural health monitoring / building automation systems.

Engineering Sensor Systems

Sensor networks and frameworks for decision making:

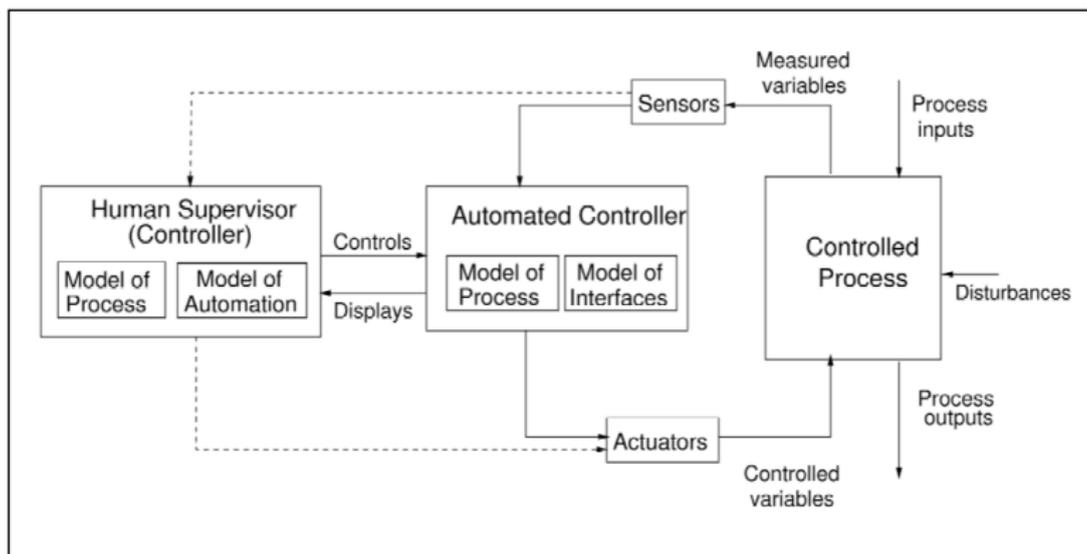

Chain of dependency relationships:

1. improved performance \leftarrow actions
2. actions \leftarrow ability to identify events.
3. identify events \leftarrow data processing
4. data processing \leftarrow types and quality of data
5. types and quality of data \leftarrow sensor design and placement.

Engineering Sensor Systems

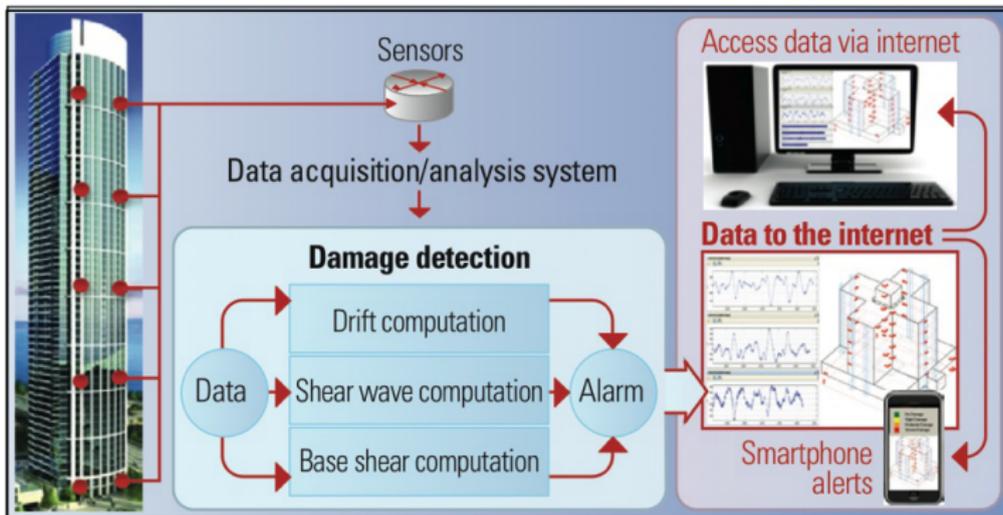

Human-in-the-Loop and Automated Control:

Source: Leveson, 2006.

Real-World Application (Structural Health Monitoring)

Flowchart of activities for real-time monitoring of instrumented buildings.

Source: <http://earthquake.usgs.gov/monitoring/buildings/>

Real-World Application (Modern Aircraft)

During the past three decades **aerospace systems** have seen **increased use** of **electrical systems** to achieve functionality.

Example 1. Boeing 777 → Boeing 787 (more electric aircraft).

Example 2. F-16 and F-35 Military Jets

F-16

F-35

Real-World Application (Modern Aircraft)

F-16 (production began 1974):

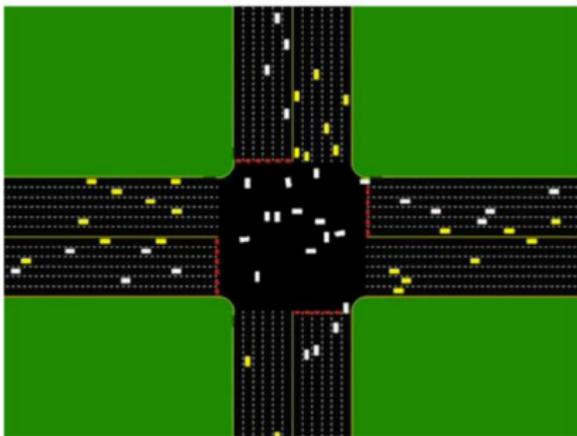

- 15 subsystems; $O(10^3)$ interfaces.
- Less than 40% of the functions managed by software.

F-35 (production began in 2006):

- 3-8 times the operational capability of previous aircraft.
- New sensor systems to support: situational awareness and targeting; sensor integration and data fusion.
- 130 subsystems; $O(10^5)$ interfaces.
- 90% of its functions are managed by software.

Real-World Application (Self-Driving Cars)

Goal. Improve performance by removing bottlenecks → no human driver; no traffic lights.

Remark: 95% of the requirements are for the system software.

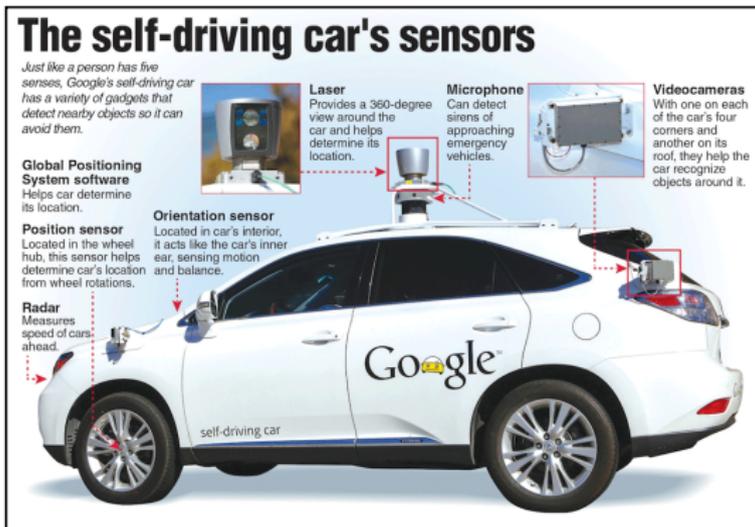

Source: ISR visitor from GM Research.

Remark: Tesla will produce self-driving cars by 2016.

Source: Elon Musk.

Stop signs and traffic lights are replaced by mechanisms for vehicle-to-vehicle communication (Adapted from <http://citylab.com>).

Real-World Application (Self-Driving Cars)

Today: Modern automobiles → 100 million lines of software.

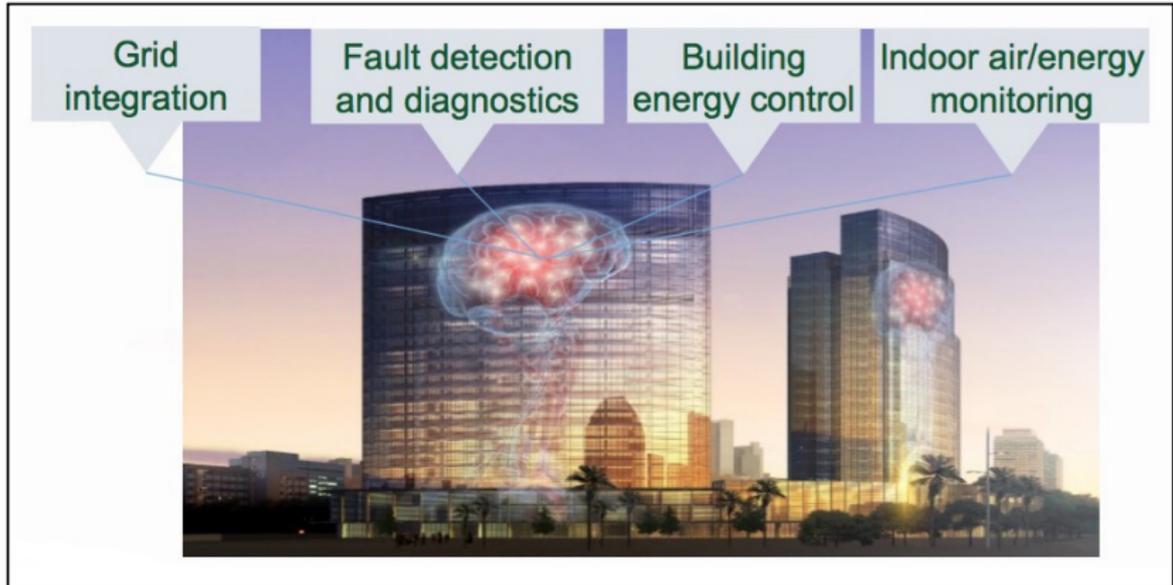

Tomorrow: Self-Driving automobiles → 200-300 million lines of software.

Urban Applications

How do buildings and cities work?

Modern Buildings (Vision for Future)

Buildings that Think! (Work at NIST/UMD 2017)

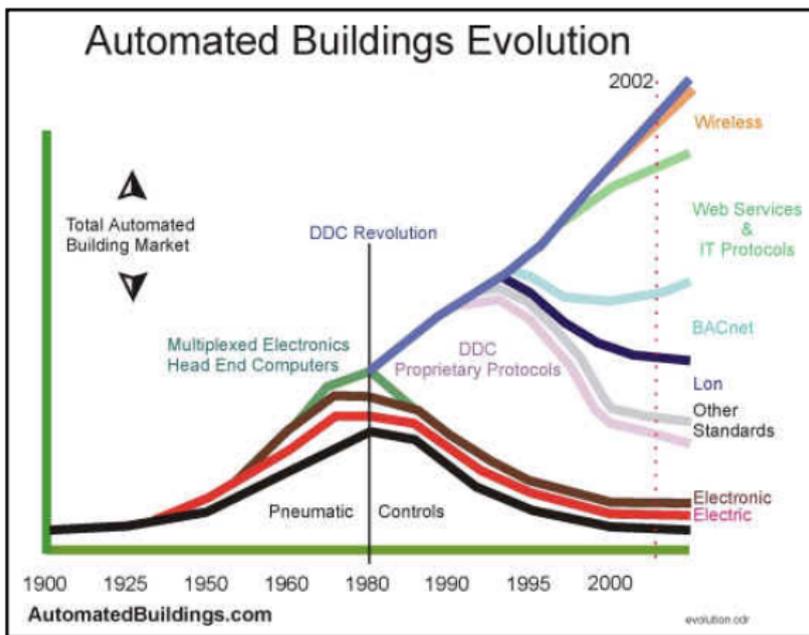

Modern Buildings (Key Features)

Modern buildings are:

- Advanced, self-contained and tightly controlled environments design to provide services (e.g., transportation, lighting, etc).
- Large size (e.g., 30,000 occupants, thousands of points of sensing and control for air quality and fire protection).
- Many stakeholders; highly multi-disciplinary.
- Buildings have networks for: arrangement of spaces; fixed circulatory systems (power, hvac); dynamic circulatory systems (flows of energy).
- Many sources of heterogeneous data.
- Necessity of performance-based design and real-time management.
- System functionality controlled by software!

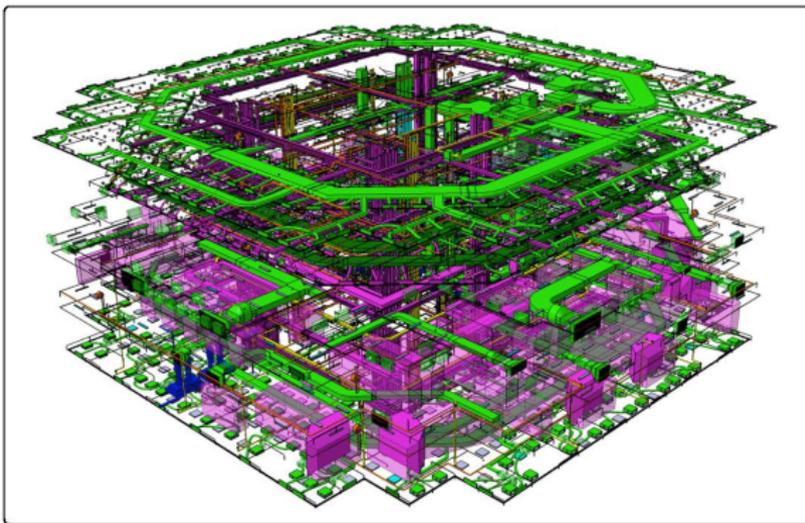

Modern Buildings (Key Features)

Large-scale building systems are packed with automation:

Modern Buildings (Key Features)

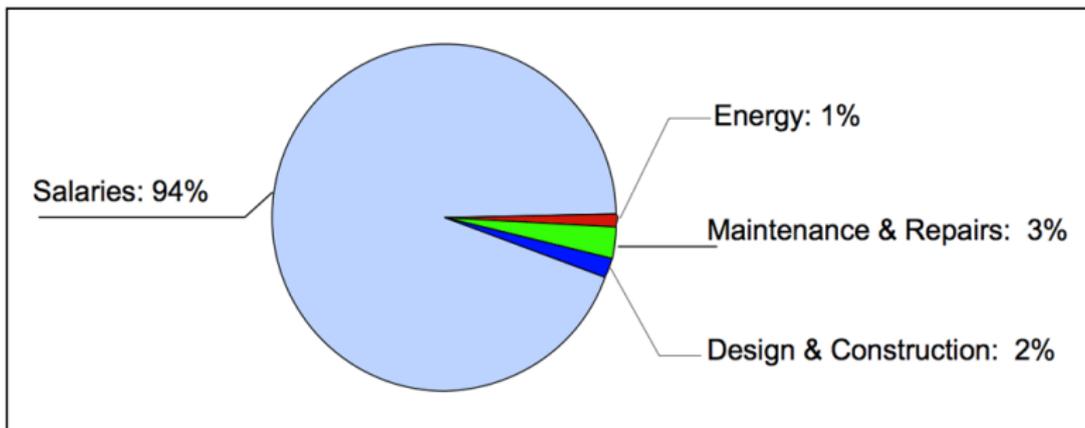

Large-scale building systems are intertwined networks of networks:

Understanding the **relationships among the networks** and their combined behaviors can be **very challenging**.

Modern Buildings (Economics)

Lifecycle costs in office buildings over a 30-Year period:

Energy systems have a huge impact on building occupant comfort and indoor air quality which, in turn, affects salary performance.

Source: United Technologies Research Center, 2009.

Modern Buildings (Integrated Energy Systems)

Trend toward Integrated Energy Systems:

- Commercial and residential buildings consume 1/3 of the world's energy.
- And by 2025, buildings will consume more energy than the transportation and industrial sectors combined.
- **Standard models** of building operation rely on **centrally produced power** as a source of high-grade energy.
- Advances in technology allow for consideration of alternatives, such as **local production of power**.

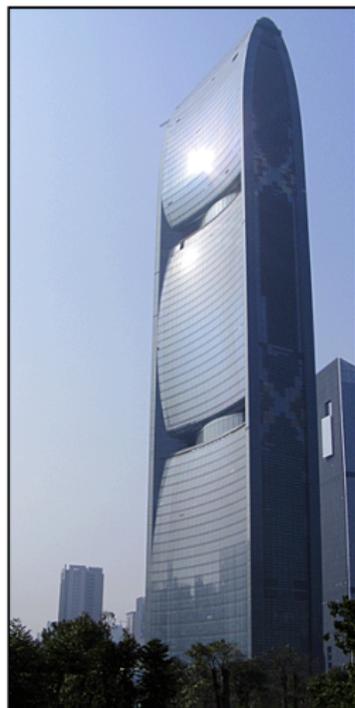

Examples:

- Solar power; small-scale combined heat and power systems.
- **Electricity production** through use of **ducted wind turbines**.

Modern Buildings (Integrated Energy Systems)

Pearl River Tower (2010):

- High performance structure designed to produce as much energy as it consumes.
- Guides wind to a pair of openings at its mechanical floors.
- Wind drives turbines that generate energy for the heating, ventilation and air conditioning systems.
- Openings provide structural relief, by allowing wind to pass through the building.

Smart Cities: Urban Sensing in Chicago

Array of Things, Chicago. Modular sensor boxes will collect real-time data on the city's environment, infrastructure and activity.

Basic Questions. How is the city used? What is going on?

Smart Cities: Urban Sensing in Chicago

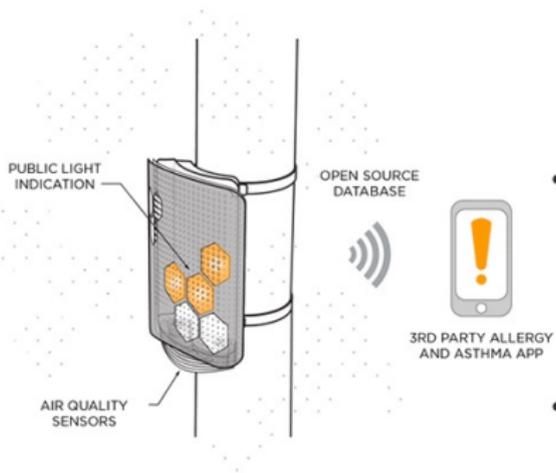

What Data is Collected?

The nodes will initially measure temperature, barometric pressure, light, vibration, carbon monoxide, nitrogen dioxide, sulfur dioxide, ozone, ambient sound intensity, pedestrian and vehicle traffic, and surface temperature. Continued research and development will help create sensors to monitor other urban factors of interest such as flooding and standing water, precipitation, wind, and pollutants.

Array of Things is interested in monitoring the city's environment and activity, not individuals. In fact, the technology and policy have been designed to specifically avoid any potential collection of data about individuals, so privacy protection is built into the design of the sensors and into the operating policies. Array of Things will not collect any personal or private information.

Smart Cities: Urban Sensing in Chicago

What Can be Done with this Data?

Potential applications of data collected by the Array of Things include:

- Sensors monitoring air quality, sound and vibration (to detect heavy vehicle traffic), and temperature can be used to suggest the healthiest and unhealthiest walking times and routes through the city, or to study the relationship between diseases and the urban environment.
- Real-time detection of urban flooding can improve city services and infrastructure to prevent property damage and illness.
- Measurements of micro-climate in different

areas of the city, so that residents can get up-to-date, high-resolution "block-by-block" weather and climate information.

- Observe which areas of the city are heavily populated by pedestrians at different times of day to suggest safe and efficient routes for walking late at night or for timing traffic lights during peak traffic hours to improve pedestrian safety and reduce congestion-related pollution.

SONYC: Sounds of New York City

SONYC. A system for monitoring, analysis and mitigation of urban noise pollution.

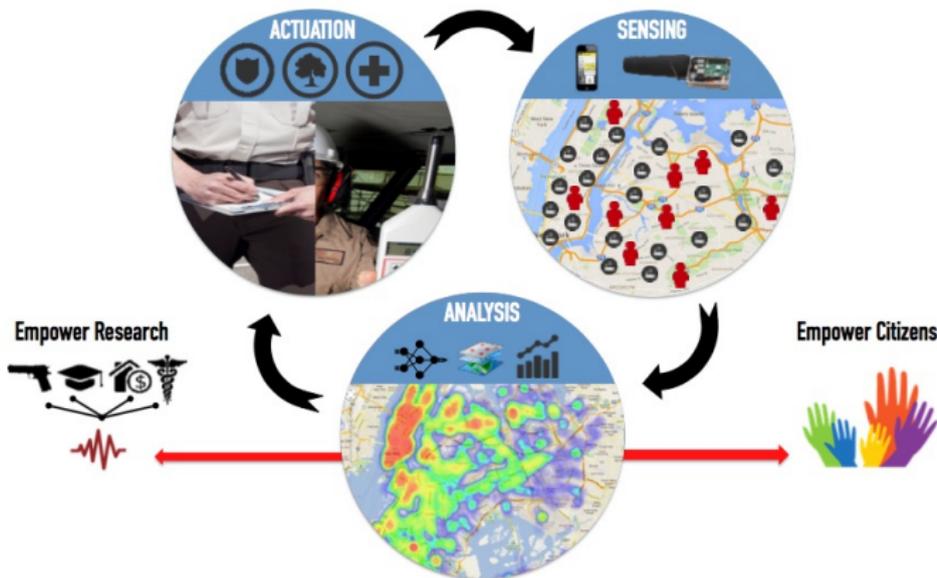

Motivation. Over 70 million people in US are exposed to noise levels beyond the limit of EPA considers to be harmful.

Short-term Problems. Sleep disruption.

Long-term Problems. Hypertension, heart disease, hearing loss.

SONYC: Sounds of New York City

Complaints. NYC authorities receive more than 800 noise-related complaints per day!

SONYC: Sounds of New York City

Noise Analytics. Analyze and understand noise pollution at a city-scale.

Global Applications

Answering Big Science Questions

NASA's Earth Observing System

NASA'S EOSDIS PROGRAM

NASA / Hughes Contract in 1993

- Project planning begins in 1989.
- Proposal submitted July 1, 1991.
- Contract awarded 1992.
- \$600 million to design and building the infrastructure for a global data and information system that can handle petabytes (2^{50} bytes) of data.
- 13 participating countries: USA, Canada, Japan, etc.
- Data collection and information processing: 1995 – 2015.

Big Science Questions:

- How is the Global Earth System changing?
- What are the primary factors that influence change?
- How does the Earth System respond to natural and human-induced actions?
- What are the consequences of change in the Earth Systems for humans?
- How will the Earth System change in the future?

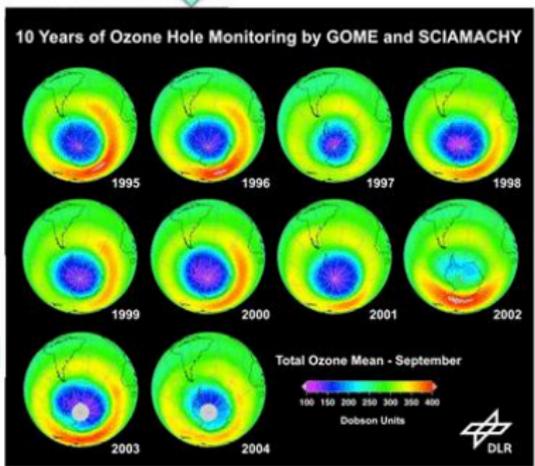

NASA's Earth Observing System

NASA'S EOSDIS → RE-NAMED EOS IN 2000

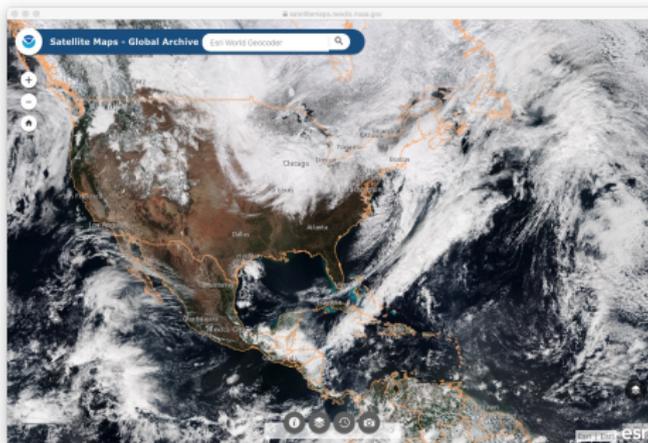

Drives innovation

Enables science

Satellite Imagery and Measurements

Understanding Climate Change

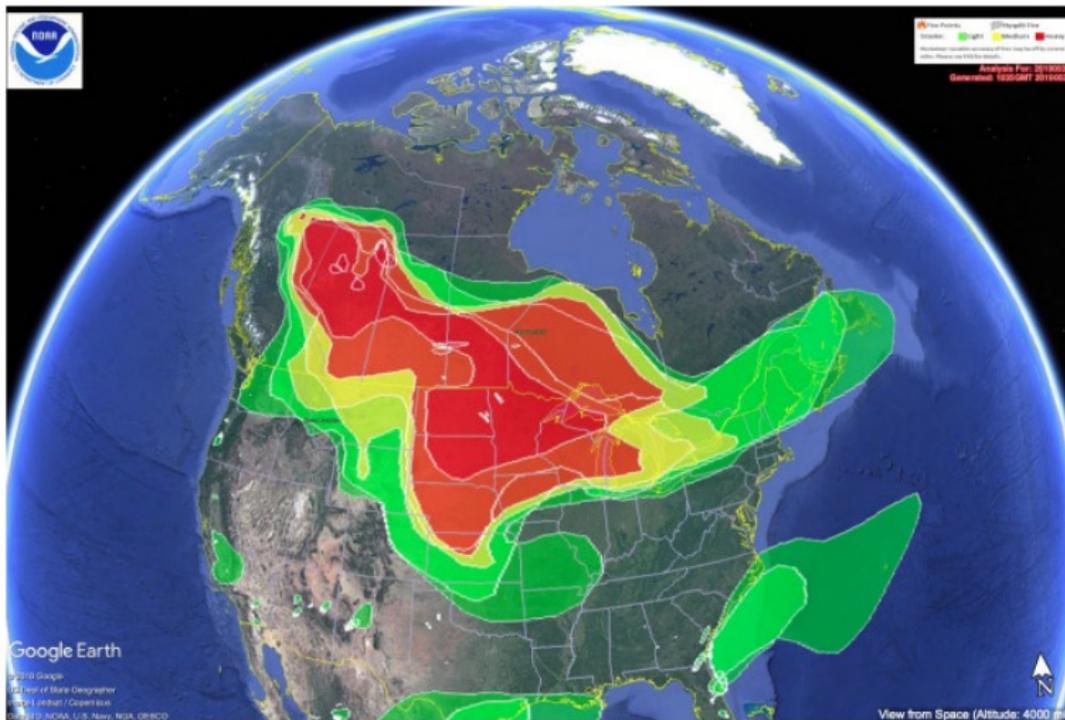

Example. Measure spatial and temporal extent of annual Snow Pack → Estimate water resources available for agriculture and urban consumption.

California Wildfires force Evacuations

Canadian Wildfires impact US

Wildfires in Alberta: Smoke covers millions of square miles:

Canadian Wildfires impact US Health/Food Chain

Poor Air Quality (Summer, 2018):

- Hundreds of wildfires in BC and WA.
- Smoke in BC drifts south to Washington State.
- Air quality in Seattle is very poor.

Wildfires impact Food Chain:

- Blankets of smoke obscure direct sunlight over orchards.
- Apples cannot grow to full size.
- Price of apples at Safeway goes up!

Summary

Recurring Themes and Key Points

Recurring Themes

- Information-age systems offer enhanced functionality and better performance, but their design is more difficult than in the past.
- Physical systems and computational systems fail in completely different ways.
- **Sensor networks** will form the **eyes and ears** of complex control and information systems.
- As system complexity increases, **more and more of the functionality** will be **managed by software!**

Key Points for Building Better Systems

Looking Forward

Use sensing and software to build better systems:

- Improve **situational awareness** – to understand what is actually happening a building or city?
- Connect **sensor measurements** to short- and long-term **urban needs** (e.g., decisions on a bus stop; longer term urban planning).
- Capture the **spatial**, **temporal**, and **intensity** aspects of environmental phenomena (e.g., fires, flooding) and their **impact** on natural (e.g., air quality) and **man-made systems** (e.g., transportation networks, food chains).
- **Look ahead** and **forecast future states** of the system?
