

# CPSG101 Carbon Footprint Infographic

## (Me vs Adult Me)

By: Christian Randolph

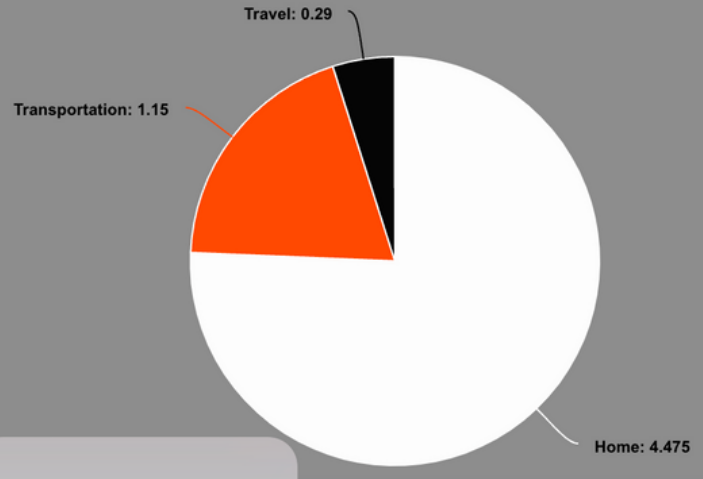

Units in tons CO<sub>2</sub>/year

### Current

- I am currently into lifting so my diet is the greatest aspect of my footprint
- As a college student, I am not required to use transportation or drive many places as everything I need is within walking distance
- I only travel over the Summer with family for vacation so not much long distance travel is done
- Total Emissions: 11.43

### Adult 4 Members

- As an adult I need to support a family via driving them places
- The average human eats an omnivorous diet
- Assuming I am living comfortably, I plan on doing vacations once a year as well
- Total Emissions: 6.9225 per person

## Takeaways

- Per capita, as a young adult, I consume more carbon than the average human
- I see myself reducing my carbon emissions within the next ten years
- One thing I could do to improve myself now is invest in eating imitation meat rather than being a pure carnivore
