

# CPSG101 Carbon Footprint Infographic

By Daniel Marshall

Current Footprint

Future Footprint

Number of Family members :4

In terms of the distribution of my carbon footprint, they are almost exactly the same in the current and future models, the magnitude of them both are different.

Household and Food taking up majority of the carbon footprint makes sense as my age means I've had a lot more time to affect carbon emissions that way than any other way.

The main reason for the differences between the carbon footprints of my current self is the fact that more food is required to sustain more individuals aside from myself.

Another reason for the difference between the footprint is that transporting more people can require more avenues of transportation that can increase carbon footprint.
