

CPSG101 Carbon Footprint

Infographic

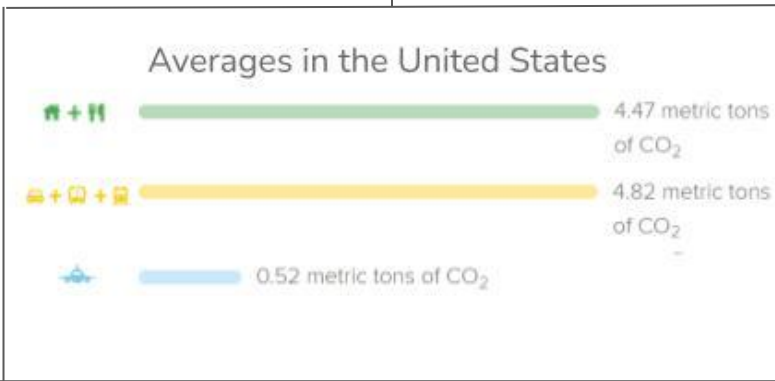

Emmalynn Malixi

Present Day

Future

Lives in an apartment
 Many residents
 Omnivore
 Utilizes train and underground train
 No car
 Travels by plane

Lives in a detached house
 Four residents
 Omnivore
 Does not utilize train or underground train
 Electric car
 Travels by plane

The differences between my present and theoretical future includes the kind of building that I live in, how many people live in the same building as me, my utilization of trains (both above and below ground), and my usage of a car. Overall, my carbon footprint in the present is less than mine in the future. For both I was above the average in respect to air travel and below for public transportation. Living in a dorm generates much less metric tons of CO₂ than living in a detached house. However, I use trains more now than I do in the future. However, the CO₂ produced from the detached house with respect to the dorm is much more significant than a few train rides. My future car is electric and therefore does not add to my CO₂ emissions.
