

CPSG Carbon Footprint Infographic

My future family will consist of my significant other and myself

	Current Freshman	Future Self	(Future) Per Capita
Total Carbon Footprint	13.91 (tons CO2/year)	33.82 (tons CO2/year)	
Total Tree Equivalent	199	483	
Household Equivalent	79 trees	249 trees	124.5 trees
Transportation Equivalent	56 trees	87 trees	43.5 trees
Travel Equivalent	6 trees	33 trees	16.5 trees

The differences in my current and future carbon footprint can be explained by changes in my lifestyle. My future self has a greater carbon footprint than my current self because I'll be holding myself to high standards of living. I will continue to make efforts to reduce my carbon footprint in the future, however, I'll be living in a larger living space with my significant other which is less energy efficient than the dorms I currently live in.

I'll also drive more in the future, but I intend to purchase cars with low carbon footprints. I also intend to travel more in the future because I'll be loaded with cash, and I would love to travel the world, which is something I can't do much of right now.
