

CPSG101 Carbon Footprint Infographic

By Henry Clay

Current and Future Carbon Emissions

This graph shows my current carbon footprint alongside my hypothetical future footprint, measured in trees and tons of CO² (0.07 Tons of CO² per Tree). My future footprint considers a family of one.

The main difference is the greater household impact in the future footprint. This is mainly because I currently live in a dorm with many other students, so household impacts are distributed among more people. Living alone, I would be responsible for the entire impact of my household.
