

CPSG101 Carbon Footprint Infographic

John Hodgins

Present Day Carbon Footprint : 9.73 t CO₂/yr, or 139 trees

Future Household (30 something years old) - 2 Members, per capita Carbon Footprint: 13.78 t CO₂/yr, 197 trees

Why the differences?

In the present day, my household consumption is much lower than in my future household because living in high density housing is much more space and energy efficient than single-family detached housing. The majority of household energy is used for heating or cooling, and high density housing uses less energy to support more people.
