Current me

Differences: One big difference is the fact that in the future me, I'm assuming I'm with more people. Another difference is that I am air traveling in the future and current me does not air travel, and another difference is that future me drives a lot more compared to the current me. The final difference is that future me gets more power from natural sources like solar and wind compared to current me. The final reason is more so just a difference rather than a cause for why my future carbon footprint is larger than my current carbon footprint.
