WHY THE DIFFERENCES?

As of right now, my carbon emissions are pretty low, this is because I'm a college student who doesn't have a car and I walk everywhere. I'm a pescatarian which lowers my emissions, I also live in a huge residents hall. In the future my carbon emissions are much higher because I plan on having a lifestyle where I travel a lot. I will fly a lot as well and use other forms of transportation more often, like car, bus, and rail. I also want to live in an apartment building with way less people per unit than I do now. All in all, my drastic increase in travel, transportation, and housing carbon output greatly increases my future carbon footprint.

PER CAPITA VALUE FOR FAMILY OF 4
