## CARBON FOOTPRINT INFOGRAPHIC

### estimates

me

present-day, my footprint is 8.98 tonnes per year, equivalent to:

 x 128

what makes up a large portion of my carbon footprint comes from my household

 x 70

luckily, I use public transit and modes of transportation that do little harm to the environment, so it makes up practically nothing of my footprint

 x 0

and, I'm way below the average on contributions to the climate as a result of travel

 x 1

### family of 5

future me

my household's carbon footprint is truly astronomical, equivalent to:

 x 685

what makes up a large portion of my carbon footprint comes from my household

 x 418

per person, our household footprint is unbelievable!

 x 83.6

and even years ahead, compared to present-day, I'll still be travelling lightly

 x 0.2

### the differences

thus, there are stark differences in my carbon footprint estimations for the present-day. with the age that I am now, I don't need a vehicle, or need to travel long distances. additionally, I don't personally need to provide for anyone but myself. yet, as an adult, everything changes — I'll need to get groceries, account for water usage by my family and their emissions, and a multitude of other factors.
